# USEFUL TABLES

FROM THE

# AMERICAN PRACTICAL NAVIGATOR.

(BOWDITCH.)

---

REVISED EDITION.

---

BUREAU OF NAVIGATION,  
NAVY DEPARTMENT.

WASHINGTON:  
GOVERNMENT PRINTING OFFICE.  
1886.

## P R E F A C E.

---

This edition of the *Useful Tables* became necessary upon the completion of the Revised Edition of the AMERICAN PRACTICAL NAVIGATOR—BOWDITCH.

The tables are all printed from the plates of the Navigator, which, with the exception of a few new tables, are all recopied from the old tables; but new type, new plates, and greater space have given them additional clearness. No corrections have been found necessary in the old tables except some errors caused by defaced plates.

This edition is intended to include all the tables ordinarily used by the Navigator. Particular attention is called to Table 5 *for finding the distance from an object by two bearings*, and Table 28 *for finding the latitude of a place by altitudes of Polaris*. The former was taken from a publication of the Hydrographic Office, and the latter from the Nautical Almanac.

---

In this edition a number of typographical errors, incidental to preparing new plates in 1881, have been eliminated, and the tables are now believed to be free from errors.

J. G. WALKER,  
*Chief of Bureau.*

BUREAU OF NAVIGATION,  
NAVY DEPARTMENT,  
*July, 1886.*

# EXPLANATION OF THE TABLES.

## TABLES 1, 2.

### TRAVERSE TABLES, OR SOLUTIONS OF PLANE RIGHT TRIANGLES.

Tables 1 and 2 were calculated by the natural sines taken from the fourth edition of Sherwin's Logarithms, which were previously examined, by differences; when the proof-sheets of the first edition were examined the numbers were again calculated by the natural sines in the second edition of Hutton's Logarithms; and if any difference was found, the numbers were calculated a third time by Taylor's Logarithms.

The first table contains the difference of latitude and departure corresponding to distances not exceeding 300, and for courses to every quarter-point of the compass. Table 2 is of the same nature and extent, but for courses consisting of whole degrees. The manner of using these tables is particularly explained under the article of Inspection, in the different Problems of Plane, Middle Latitude, and Mercator's Sailing.

These tables may also be employed in the solution of right-angled triangles, as may be seen in Art. 112, Chap. III, Part I.

## TABLE 3.

### MERIDIONAL PARTS.

This table contains the meridional parts, or increased latitudes, for every degree and minute to  $87^{\circ}$ , calculated by the following formula, viz :

$$m = \frac{a}{M} \log \tan \left( 45^{\circ} + \frac{L}{2} \right) - a (e^2 \sin L + \frac{1}{3} e^4 \sin^3 L)$$

In which

$$\text{the Equatorial radius } a = \frac{10800'}{\pi} = 3437'.74677 \quad \log 3.5362739$$

$$M, \text{ the modulus of common logarithms} = 0.4342945$$

$$\frac{1}{M} = 2.3025851 \quad \log 0.3622157$$

C, the *compression* or meridional eccentricity of the earth ac-

$$\text{cording to Bessel} = \frac{1}{299.1528} = 0.003342773 \quad \log 7.5241069$$

$$e = \sqrt{2c - c^2} = 0.0816968 \quad \log 8.9122052$$

From which

$$\frac{a}{M} = 7915'.7055 \quad \log 3.8984896$$

$$ae^2 = 22'.9448 \quad \log 1.3606843$$

$$\frac{1}{3}ae^4 = 0'.05104731 \quad \log 8.7079734$$

The results are tabulated to one decimal place, being sufficient for the ordinary problems of navigation.

The practical application of this table is illustrated in Art. 66, Chap. II, Part I, and in the various problems of Mercator's Sailing, Chap. III, Part I.

## TABLE 4.

This table gives the length of a degree in both latitude and longitude at each parallel of latitude on the earth's surface.

## TABLE 5.

This table has been calculated to facilitate the operation of finding the distance from an object by two bearings, having the distance run and course. In the first part of the table the arguments are given in points; in the second part, in degrees.

It is illustrated in Art. 148, Chap. IV, Part I.

## TABLE 6.

This table contains the distances at which any object is visible at sea calculated by the formula

$$d = 1.317 \sqrt{x} \text{ in feet,}$$

in which  $d$  is the distance in statute miles,  $x$  the height of the eye or the object in feet.

The explanations and use of this table are given in the Useful Problems of the Appendix.

# EXPLANATION OF THE TABLES.

**TABLE 7.**

*To reduce Longitude into Time, and the contrary.*—In the first column of this table are contained degrees and minutes of longitude, in the second the corresponding hours and minutes, or minutes and seconds of time; the other columns are a continuation of the first and second respectively. The use of this table will evidently appear by a few examples.

EXAMPLE I.			EXAMPLE II.		
Required the time corresponding to 50° 31'.			Required the degrees and minutes corresponding to		
	<i>h.</i>	<i>m.</i>	6 <sup>h</sup> 33 <sup>m</sup> 20 <sup>s</sup> .		
Opposite 50° in col. 1 is.....	3	20 0	Opposite 6 <sup>h</sup> 32 <sup>m</sup> 0 <sup>s</sup> .....	in col. 4 is.....	98° 0'
31' .....		2 4	1 20 .....	in col. 2 is.....	20
Sought time .....	3	22 4	6 33 20		98 20

**TABLE 8.**

*To convert Sidereal Time into Mean Solar Time.*

**TABLE 9.**

*To convert Mean Solar Time into Sidereal Time.*

**TABLE 10**

Contains the time of true rising and setting computed by the formula

$$\cos H. A. = \tan \text{dec} \times \tan \text{latitude.}$$

*To find the Time of the Sun's Rising and Setting, and the Length of the Day and Night.*

**RULE.** Find the sun's declination at the top of the table, and the latitude in either side column; under the former, and opposite the latter, will be the time of the sun's setting if the latitude and declination are of the same name, but the time of rising if of different names. The time of rising, subtracted from 12 hours, will give the time of setting; or the time of setting, subtracted from 12 hours, will give the time of rising. The time of rising, being doubled, will give the length of the night; and the time of setting, being doubled, will give the length of the day.

For the SUN the H. A. is the app. time of rising or setting.

For the MOON or a STAR. Find the app. time (or mean time, as required) of the meridian passage. Then, for approximate time at *rising*, subtract the hour angle from the time of meridian passage (increased by 24<sup>h</sup> if necessary); for approximate time of *setting* add them together, rejecting 24<sup>h</sup> in the result if it exceeds that.

It may be noted that the numbers of Table 10 were calculated for the moment the sun's centre appears in the true horizon; allowance ought to be made for the dip, parallax, and refraction, by which the sun and stars, when near the horizon, appear in general to be elevated above half a degree above their true place, and the moon as much below her true place.

**TABLE 14.**

This table contains the dip of the sea horizon, calculated by the formula

$$D = 58'' \cdot 8 \sqrt{F},$$

in which F = height of the eye above the level of the sea in feet.

It is explained in Art. 251, Chap. V, Part II.

**TABLE 15.**

The table contains the dip for various distances and heights, calculated by this rule,

$$D = \frac{3}{7}d + 0.56514 \times \frac{h}{d}$$

in which D represents the dip in miles or minutes, *d* the distance of the land in sea miles, and *h* the height of the eye of the observer in feet.

**TABLE 16.**

The table contains the Sun's parallax in altitude calculated by the formula

$$\text{par.} = \sin Z \times 8''.75 \text{ (}\odot\text{'s Hor. Par.)}$$

in which Z = apparent zenith distance.

It is explained in Art. 247, Chap. V, Part II.

**TABLE 17.**

Parallax in altitude of a planet is found by entering at the top with the planet's horizontal parallax, and at the side with the altitude.

**TABLE 18.**

The table gives the augmentation of the moon's semi-diameter calculated by the formula,

$$x = c s^2 \sin h + \frac{1}{2} c^2 s^3 \sin^2 h + \frac{1}{2} c^3 s^3,$$

in which

$h$  = moon's apparent altitude.

$s$  = moon's horizontal semi-diameter.

$x$  = augmentation of semi-diameter for altitude  $h$ .

$$\log c = 5.25021.$$

**TABLE 19.**

The table contains the augmentation of the moon's horizontal parallax, or the correction to reduce the moon's equatorial horizontal parallax to that point of the earth's axis which lies in the vertical of the observer in any given latitude, computed by the formulas

$$\Delta \pi = \pi (b - 1), \quad b = \frac{1}{\sqrt{1 - e^2 \sin^2 \phi}},$$

where  $\pi$  = equatorial horizontal parallax.

$\phi$  = latitude.

$e$  = eccentricity of the meridian;  $\log e^2 = 7.81602$ .

$\Delta \pi$  = augmentation of the horizontal parallax for the latitude  $\phi$ .

**TABLE 20.**

*Mean refraction*, reduced from Bessel's tables, to barometer 30<sup>in</sup> and thermometer 50°.

**TABLES 21, 22.**

*Corrections of the mean refraction for the height of the barometer and thermometer*, deduced also from Bessel's table.

**TABLE 26.**

Table 26 contains the variation of the altitude of any heavenly body, for one minute of time from noon, for various degrees of latitude and declination. The following method was used in constructing the table: A and B were calculated for each degree of declination by these formulas:

$$\text{Log A} = \log 1''.96349 + 2 \log \cos \text{declination} - 20.00000,$$

$$\text{Log B} = \log A + \log \tan \text{declination} - 10.00000;$$

and then the correction of the table corresponding to the zenith distance Z (= lat.  $\frac{+}{-}$  dec.) was found by this formula: A  $\times$  cotan Z  $\pm$  B. To facilitate the computation of these numbers, a table of the products of A by the whole numbers from 1 to 9 was calculated.

**TABLE 27.**

Table 27 contains the squares of the minutes and parts of a minute of time corresponding to every second from 0<sup>s</sup> to 12<sup>m</sup> 59<sup>s</sup>. This requires no explanation.

The manner of using the two preceding tables is exemplified in the body of the work in finding the latitude by reduction to the meridian, Art. 278, Chap. VII, Part II.

**TABLE 28, A, B, C, D.**

*For finding the Latitude of a Place by Altitudes of Polaris.*

The formula\* on which these tables are based is

$$L = h - p \cos t + \frac{1}{2} p^2 \sin 1'' \sin^2 t \tan h \\ - \frac{1}{3} p^3 \sin^2 1'' \cos t \sin^2 t + \frac{1}{8} p^4 \sin^3 1'' \sin^4 t \tan^3 h;$$

in which

$L$  = the latitude of the place, and

$h$  = the true altitude,

$p$  = the polar distance, and

$t$  = the hour angle of the star.

Table A contains for the declination 88° 40', or  $p_0 = 1^\circ 20'' = 4800''$ , the *first correction*,

$$A = -p_0 \cos t - \frac{1}{3} p_0^3 \sin^2 1'' \cos t \sin^2 t;$$

Argument, *the hour angle of the star*, or 24<sup>h</sup> = the hour angle.

Table B contains the *second correction*,

$$B = \frac{1}{2} p_0^2 \sin 1'' \sin^2 t \tan h + \frac{1}{8} p_0^4 \sin^3 1'' \sin^4 t \tan^3 h;$$

Arguments, *the true altitude of the star* and the *hour angle*, or 24<sup>h</sup> = the hour angle. This correction is always additive.

Table C contains the *third correction*,

$$C = \frac{1}{2} (p^2 - p_0^2) \sin 1'' \sin^2 t \tan h;$$

Arguments, *B* and the *declination of the star* from  $88^\circ 39' 20''$  to  $88^\circ 41' 20''$ .

Table D contains the *fourth correction*,

$$-(p - p_0) \cos t - \frac{1}{3} (p^3 - p_0^3) \sin^2 1'' \cos t \sin^2 t;$$

Arguments, *A* and the *declination of the star* from  $88^\circ 39' 20''$  to  $88^\circ 41' 20''$ .

The quantities are given to the nearest  $0''.1$ : a . placed after some of them indicates a doubt between the figure given and the next highest, or that the correct value is  $0''.05$  greater than that given. Thus,  $3''.7$  . indicates the actual value  $3''.75$ .

#### TABLE 39.

The table contains amplitudes of heavenly bodies, at rising and setting, for various latitudes and declinations, computed by the formula

$$\sin \text{amp.} = \sec \text{Lat.} \times \sin \text{dec.}$$

It is entered with the declination at the top and the latitude at the side.

Its use is explained in Chap. X, Part II, Art. 324.

#### TABLE 40.

This table gives a correction to be applied to the observed amplitude to counteract the vertical displacement due to refraction, parallax, and dip, when the body is observed with its centre in the visible horizon.

The correction is to be applied for the Sun, a Planet, or a Star.

At Rising in N. Lat. }	}	apply the correction to the right.
Setting in S. Lat. }		
At Rising in S. Lat. }	}	apply the correction to the left.
Setting in N. Lat. }		

For the Moon—

Apply *half* the correction in the *contrary* manner.

#### TABLE 41.

*Natural Sines.*—This table contains the natural sine and cosine for every minute of the quadrant to the radius 100000, and is to be entered at the top or bottom with the degrees, and at the side marked M., with the minutes; the corresponding numbers will be the natural sine and cosine respectively, observing that if the degrees are found at the top, the name sine, cosine, and M. must also be found at the top, and the contrary if the degrees are found at the bottom. Thus, 43366 is the natural sine of  $25^\circ 42'$ , or the cosine of  $64^\circ 18'$ .

We have given in this edition of the present table, in the outer columns of the margin, tables of proportional parts, for the purpose of finding, nearly, by inspection, the proportional part corresponding to any number of seconds in the proposed angle; the seconds being found in the marginal column marked M., and the correction in the adjoining column. Thus, if we suppose that it were required to find the natural sine corresponding to  $25^\circ 42' 19''$ , the difference of the sines of  $25^\circ 42'$  and  $25^\circ 43'$  is 26; being the same as at the top of the left-hand column of the table; and in this column, and opposite to  $19''$ , in the column M., is the correction 8. Adding this to the above number 43366, because the numbers are *increasing*, we get 43374 for the sine of  $25^\circ 42' 19''$ . In like manner, we find the cosine of the same angle to be  $90108 - 4 = 90104$ , using the right-hand columns, and *subtracting* because the numbers are *decreasing*; observing, however, that the number 14 at the top of this column varies 1 from the difference between the cosines of  $25^\circ 42'$  and  $25^\circ 43'$ , which is only 13; so that the table may give in some cases a unit too much between the angles  $25^\circ 42'$  and  $25^\circ 43'$ ; but this is, in general, of but little importance, and when very great accuracy is required, the usual method of proportional parts is to be resorted to, using the actual tabular difference.

#### TABLE 42.

Table 42, containing the common logarithms of numbers, was compared with Sherwin's, Hutton's, and Taylor's logarithms.

#### TABLE 43.

Table 43 contains the log sines, log tangents, &c., corresponding to points and quarter points of the compass. This was compared with Sherwin's, Hutton's, and Taylor's logarithms.

#### TABLE 44.

Table 44 contains the common log sines, tangents, secants, &c. This was compared with Sherwin's, Hutton's, and Taylor's tables. Two additional columns are given in this table, which are very convenient in finding the time from an altitude of the sun; also, three columns of proportional parts for seconds of space, and a small table at the bottom of each page for finding the proportional parts for seconds of time. The degrees are marked to  $180^\circ$ , which saves the trouble of subtracting the given angle from  $180^\circ$  when it exceeds  $90^\circ$ .

The foregoing logarithmic tables are fully explained in the Appendix in an article on Logarithms.

TABLE 45.

Table 45 contains the proportional logarithms for three hours. The numbers of this table may be found by subtracting the logarithm of the time in seconds from the log of 10800'', or, which is the same thing, by the following rule:

$$\text{Prop. log T} = 4.0334738 - \text{log of T in seconds.}$$

*Proportional Logarithms.*—These logarithms are very useful in finding the mean time at Greenwich corresponding to the true distance of the moon from the sun or star, as is explained in the examples of working a lunar observation. They may be also used, like common logarithms, in working any proportion where the terms are given in degrees, minutes, and seconds, or in hours, minutes, and seconds, as in the example of taking a lunar observation by one observer. The table is extended only to 3<sup>o</sup> or 3<sup>h</sup>; and if any of the terms of a given proportion exceed 3<sup>o</sup> or 3<sup>h</sup>, you may take all the terms one grade lower; that is, reckon degrees as minutes, minutes as seconds, &c., and work the proportion as before, observing to write down the answer one grade higher; that is, you must estimate minutes as degrees, seconds as minutes, &c. Instead of taking all the terms one grade lower, you may change **two of the terms only**, viz, one of the middle terms and one of the extreme terms; thus, the 1st and 3d or the 1st and 2d may be taken one grade less, and the fourth term will be given correctly; but if the fourth term be taken one grade less, you must, after working the proportion, write it one grade higher, as is evident. To illustrate this, we shall give the following examples:

## EXAMPLE 1.

If in 15<sup>m</sup> 10<sup>s</sup> of time the sun rises 2<sup>o</sup> 40', how much will it rise in 3<sup>m</sup> 10<sup>s</sup> at the same rate?

As 15 <sup>m</sup> 10 <sup>s</sup> ,	Arith. Comp.,	Prop. Log 8.9256
Is to 2 <sup>o</sup> 40',		Prop. Log .0512
So is 3 <sup>m</sup> 10 <sup>s</sup> ,		Prop. Log 1.7547
To 33' 24'',		Prop. Log .7315

## EXAMPLE 2.

If the sun's declination changes 16' 19'' in 24 hours, how much will it change in 8<sup>h</sup> 2<sup>m</sup>?

Here the 1st and 3d terms must be taken one grade less.

As 24 <sup>m</sup> 0 <sup>s</sup> ,	Arith. Comp.,	Prop. Log 9.1249
Is to 16' 19'',		Prop. Log 1.0426
So is 8 <sup>m</sup> 2 <sup>s</sup> ,		Prop. Log 1.3504
To 5' 28'',		Prop. Log 1.5179

## REMARKS OF PROFESSOR PIERCE.

---

By the admirable contrivance of logarithms, the name of their inventor was raised high in the list of the benefactors of his race and the promoters of science. All the numerical calculations in the higher departments of theoretical and practical mathematics are performed by their aid, and the success of the computer principally depends upon the skill and precision with which he uses his logarithmic tables. It is worthy of inquiry, then, whether instruction in their use should not be more common in the schools; they ought to be studied both as the most remarkable instrument for facilitating calculations and as a useful means of forming the mind to habits of accuracy. Discretion should be exercised in the choice of the tables, for, if ill-constructed and inaccurate, they will certainly lead to awkward and slovenly forms of calculation. They should be well proportioned in their parts; and, if of small extent, they should not be carried beyond five places of decimals. It is a great mistake to carry the small tables to six or seven places of decimals; without any valuable increase of accuracy, they are thus rendered clumsy and inconvenient. Tables of seven places should be proportionally extensive, as the large ones of Taylor, while those of six places are of little value, for they are not delicate enough for the higher orders of calculation, and are not needed for inferior operations; but, on the contrary, the disproportionate labor of using them destroys that brevity of computation which is the sole recommendation of logarithms. None of the smaller tables can be compared in accuracy with those of Dr. Bowditch, for, besides the repeated and rigid examinations to which they have been subjected by the author and his sons, they have been so long in common use that no important error can have escaped detection. Dr. Bowditch's singular practical tact is also exhibited in their skillful arrangement, of which they are models deserving careful study. Feeling the want of such a set of tables for popular use, I have urged upon their proprietors the expediency of publishing the following selection from them, which will, I hope, be regarded as judiciously made.

This may not be thought an improper occasion to press upon teachers the inexpediency of forcing the youthful intellect to a premature comprehension of abstruse mathematical reasoning, at the expense of failing to impart familiarity with the forms of calculation, and readiness and accuracy in the use of figures, at the flexible age when the seeds of habit most readily germinate. Teach the lad how to obtain results, and you inspire him with the surest stimulus to investigate and apprehend the nature of the process. Imbue him with the spirit of accuracy, and you give him a taste for definite and precise thought, which is the solid foundation of true science, and one of the best antidotes to the laxity of reasoning and vagueness of research with which the atmosphere of the times is infected.

BENJAMIN PIERCE,

*Perkins Professor of Astronomy and Mathematics, Harvard University.*

CAMBRIDGE, 1849.

Note.—When turning seconds of arc into time, and vice versa, it should be remembered that the fractions are sixtieths, thus: The value in time of  $42''$  is not  $2^s.48$ , but  $2^s.\frac{42}{60}$   $= 2^s.8$ .

TABLE 8.

### Sidereal into Mean Solar Time.

To be subtracted from a sidereal time interval.

Side.	0 <sup>h</sup>		1 <sup>h</sup>		2 <sup>h</sup>		3 <sup>h</sup>		4 <sup>h</sup>		5 <sup>h</sup>		6 <sup>h</sup>		7 <sup>h</sup>		For seconds.

For finding the variation of the Sun's Right Ascension, of the Declination, of the Equation of Time, or of the Moon's Right Ascension, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

For finding the Variation of the Sun's Right Ascension, of the Declination, of the Equation of Time, or of the Moon's Right Ascension, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

For finding the Variation of the Sun's Right Ascension, of the Declination, of the Equation of Time, or of the Moon's Right Ascension, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also, for finding the Variation of the Moon's Declination in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

For finding the Variation of the Sun's Right Ascension, of the Declination, of the Equation of Time, or of the Moon's Right Ascension, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

For finding the Variation of the Sun's Right Ascension, of the Declination, of the Equation of Time, or of the Moon's Right Ascension, in any number of minutes of time, the Horary Motion being given at the top of the page in seconds, and the number of minutes of time in the side column. Also for finding the Variation of the Moon's Declination in seconds of time, the motion in one minute being given at the top, and the numbers in the side column being taken for seconds.

M.	Horary motion.															M.

Table showing the variation of the altitude of an object arising from a change of 100 seconds in the declination. If the change move the body toward the elevated pole apply the correction to the altitude with the signs in the Table; otherwise, change the signs.

For finding the Latitude of a place by Altitudes of Polaris.

A = 1st correction. Argument, the star's hour angle (or  $24^h$  - the star's hour angle).

m.	0 <sup>h</sup>				1 <sup>h</sup>				2 <sup>h</sup>				3 <sup>h</sup>				4 <sup>h</sup>				5 <sup>h</sup>				m.

NOTE.—The numbers in the columns and lines marked \* are exact.

For finding the Latitude of a place by Altitudes of Polaris.

D = the 4th correction. (D has the same sign as A when the Dec. &lt; 88° 40', the opposite sign when the Dec. &gt; 88° 40'.)

Vertical Argument, A = the 1st correction. Horizontal Argument, the star's declination.

A.	Declination, 88° 40'.						88° 44'.					Proportional parts.

The correction is to be added to the approximate Greenwich time when the proportional logarithms in the Ephemeris are decreasing, and subtracted when they are increasing.

For finding the value of N for Correcting Lunar Distances for the Compression of the Earth.

Table 36 A, giving 1st part of N.

Table 36 B, giving 2d part of N.

App. dist.	Moon's declination.											App. dist.	Star's declination.

and by Parallel Sailing—

Since

$$\begin{aligned} D. Lo. &= Dep. \sec. Mid. L. \\ Dep. &= Dist. \sin C. \\ D. Lo. &= Dist. \sin C. \sec. Mid. L. \end{aligned}$$

**Art. 121.** From these equations the following Table is formed, which contains all the rules necessary for solving the various cases of Middle Latitude Sailing:

Case.	Given.	To find.	Solutions.
1	Both latitudes and longitudes.	Departure ..... Course ..... Distance .....	$Dep. = D. Lo. \times \cos Mid. L.$ $Tan. C. = Dep. \div D. Lo. \text{ or } \tan C. = (\cos Mid. L. \times D. Lo.) \div D. Lo.$ $Dist. = sec C. \times D. Lo. \text{ or } Dist. = Dep. \div \sin C.$
2	Both latitudes and departure.	Course ..... Distance ..... Difference of longitude .....	$Tan C. = Dep. \div D. Lo.$ $Dist. = Dep. \div \sin C.$ $D. Lo. = Dep. \div \cos Mid. L.$
3	One latitude, course, and distance.	Difference of latitude ..... Departure ..... Difference of longitude .....	$D. L. = Dist. \times \cos C.$ $Dep. = Dist. \times \sin C.$ $D. Lo. = Dep. \times \sec Mid. L. \text{ or } (Dist. \times \sin C \times \sec Mid. L.)$
4	Both latitudes and course.	Departure ..... Distance ..... Difference of longitude .....	$Dep. = D. Lo. \times \tan C.$ $Dist. = D. Lo. \div \cos C.$ $D. Lo. = Dep. \times \sec Mid. L. \text{ or } D. Lo. \times \tan C \times \sec Mid. L.$
5	Both latitudes and distance.	Course ..... Departure ..... Difference of longitude .....	$Cos C. = D. Lo. \div Dist.$ $Dep. = Dist. \times \sin C.$ $D. Lo. = Dep. \times \sec Mid. L.$
6	One latitude, course, and departure.	Difference of latitude ..... Distance ..... Difference of longitude .....	$D. L. = Dep. \div \tan C.$ $Dist. = Dep. \div \sin C.$ $D. Lo. = Dep. \times \sec Mid. L.$
7	One latitude, distance, and departure.	Course ..... Difference of latitude ..... Difference of longitude .....	$Sin C. = Dep. \div Dist.$ $D. L. = Dist. \times \cos C.$ $D. Lo. = Dep. \times \sec Mid. L.$

**Art. 122.** The assumption that

$$Mid. L. = \frac{1}{2} (L. + L')$$

is sufficiently accurate for small distances, but where great precision is desirable there must be applied a small correction to the Middle Latitude which is given in the following Table:

Table.

This Table contains the correction, in minutes, to be added to the Middle Latitude to obtain the corrected Middle Latitude.

MID. LAT.	DIFFERENCE OF LATITUDE.																MID. LAT.
	1°	2	3°	4°	5°	6	7	8°	9°	10	12	14	16°	18°	20°		
0	1		1	1	1	1	1	1	1	1	1	1	1	1	1	1	
15	0	1	2	3	5	7	9	12	15	18	26	36	47	59	72	15	
18	0	1	1	3	4	6	8	10	13	16	23	32	41	52	64	18	
21	0	1	1	2	4	5	7	9	12	15	21	29	37	47	58	21	
24	0	1	1	2	3	5	7	9	11	14	20	27	35	44	54	24	
30	0	1	1	2	3	5	6	8	10	13	18	25	32	41	50	30	
35	0	1	1	2	3	4	6	8	10	12	18	24	32	40	49	35	
40	0	1	1	2	3	5	6	8	10	13	18	25	32	41	50	40	
45	0	1	1	2	3	5	6	8	11	13	19	26	34	43	53	45	
50	0	1	1	2	4	5	7	9	11	14	20	28	36	46	57	50	
55	0	1	1	3	4	6	8	10	13	16	22	31	40	51	63	55	
58	0	1	2	3	4	6	8	11	14	17	24	33	43	55	68	58	
60	0	1	2	3	4	6	9	11	14	18	26	35	46	58	72	60	
62	0	1	2	3	5	7	9	12	15	19	27	37	49	62	77	62	
64	0	1	2	3	5	7	10	13	16	20	29	40	52	67	83	64	
66	0	1	2	4	5	8	11	14	18	22	32	43	57	72	90	66	
68	0	1	2	4	6	8	12	15	19	24	34	47	62	79	99	68	
70	0	1	2	4	6	9	13	16	21	26	38	52	68	88	110	70	
72	0	1	3	5	7	10	14	18	23	29	42	58	76	98	124	72	

This Table is to be entered at the top with the *difference* of the two latitudes, and at the side with the *middle latitude*; under the former, and opposite to the latter, is the correction, in minutes, to be added to the middle latitude, to obtain the corrected middle latitude.

Having any decimal fraction it is easy to find its value in the lower denominations of the same quantity; thus, if the fraction was the decimal of a yard, by multiplying it by 3 gives its value in feet and parts; multiplying this by 12, the product is its value in inches and parts; and in the same manner the values may be obtained in other cases.

## EXAMPLE VI.

Required the value of 3.25 yards.

$$\begin{array}{r} 3.25 \\ 3 \end{array}$$

$$\begin{array}{r} .75 \\ 12 \end{array}$$

$$\begin{array}{r} 9.00 \end{array}$$

Answer, 3 yards, 0 feet, 9 inches.

## EXAMPLE VII.

Required the value of 7.231 days.

$$\begin{array}{r} 7.231 \\ 24 \end{array}$$

$$\begin{array}{r} 924 \\ 462 \end{array}$$

$$\begin{array}{r} 5.544 \\ 60 \end{array}$$

$$\begin{array}{r} 32.640 \\ 60 \end{array}$$

$$\begin{array}{r} 38.400 \end{array}$$

Answer, 7 days, 5 hours, 32 minutes, 38 seconds, and 4 tenths of a second.

## LOGARITHMS.

In order to abbreviate the tedious operations of multiplication and division with large numbers, a series of numbers, called Logarithms, was invented by Lord Napier, baron of Marchinston, in Scotland, and published in Edinburgh in 1614, by means of which the operation of multiplication may be performed by addition and division by subtraction. Numbers may be involved to any power by simple multiplication and the root of any power extracted by simple division.

In Table 42 are given the logarithms of all numbers, from 1 to 9999; to each one must be prefixed an index, with a period or dot to separate it from the other part, as in decimal fractions; the numbers from 1 to 100 are published in that table with their indices; but from 100 to 9999 the index is left out for the sake of brevity; but it may be supplied by this general rule, viz: *The index of the logarithm of any integer or mixed number is always one less than the number of integral places in the natural number.* Thus, the index of the logarithm of any number (integral or mixed) between 10 and 100 is 1; from 100 to 1000 it is 2; from 1000 to 10000 is 3, &c.; the method of finding the logarithms from this table will be evident from the following examples:

*To find the logarithm of any number less than 100.*

RULE. Enter the first page of the table, and opposite the given number will be found the logarithm with its index prefixed.

Thus, opposite 71 is 1.85126, which is its logarithm.

*To find the logarithm of any number between 100 and 1000.*

RULE. Find the given number in the left-hand column of the table of logarithms, and immediately under 0 in the next column is a number, to which must be prefixed the number 2 as an index (because the number consists of three places of figures) and the sought logarithm will be found.

Thus, if the logarithm of 149 was required; this number being found in the left-hand column, against it, in the column marked 0 at the top (or bottom) is found 17319, to which prefixing the index 2, we have the logarithm of 149 = 2.17319.

*To find the logarithm of any number between 1000 and 10000.*

RULE. Find the three left-hand figures of the given number in the left-hand column of the table of logarithms, opposite to which, in the column that is marked at the top (or bottom) with the fourth figure, is to be found the sought logarithm; to which must be prefixed the index 3, because the number contains four places of figures.

Thus, if the logarithm of 1495 was required; opposite to 149, and in the column marked 5 at the top (or bottom) is 17464, to which prefix the index 3, and we have the sought logarithm, 3.17464.

*To find the logarithm of any number above 10000.*

RULE. Find the three first figures of the given number in the left-hand column of the table, and the fourth figure at the top or bottom, and take out the corresponding number as in the preceding rule; take also the difference between this logarithm and the next greater, and multiply it by the given number exclusive of the four first figures; cross off, at the right-hand of the product, as many figures as in the given number to multiply by; then add the remaining left-hand figures of this product to the logarithm taken from the table, and to the sum prefix an index equal to one less than the number of integral figures in the given number, and the sought logarithm will be found. To facilitate the calculation of these proportional parts several small tables are placed in the margin, which give the correction corresponding to the difference D, and to the fifth figure of the proposed number. The use of these tables will be seen in the following examples:

Thus, if the logarithm of 14957 was required; opposite to 149, and under 5, is 17464, the difference between this and the next greater number, 17493, is 29, the difference D; this multiplied by 7 (the last figure of the given number) gives 203; crossing off the right-hand figure leaves 20.3 or 20 to be added to 17464, which makes 17484; to this, prefixing the index 4, we have the sought logarithm, 4.17484. This correction, 20, may also be found by inspection in the small table in the margin, marked at the top with D = 29, and opposite to the fifth figure of the number, namely 7, at the side; the corresponding number is the correction, 20.

Again, if the logarithm of 1495738 was required; the logarithm corresponding to 149 at the left, and 5 at the top, is, as in the last example, 17464; the difference between this and the next greater is 29; multiplying this by 738 (which is equal to the given number, excluding the four first figures) gives 21402; crossing off the three right-hand figures of this product (because the number 738 consists of three figures), we have the correction 21 to be added to 17464; and the index to be prefixed is 6, because the given number consists of 7 places of figures; therefore the sought logarithm is 6.17485. This correction, 21, may be found as above, by means of the marginal table, marked at the top with  $D = 29$ , and at the side 7.38 or  $7\frac{1}{2}$  nearly, to which corresponds 21, as before.

*To find the logarithm of any mixed decimal number.*

RULE. Find the logarithm of the number, as if it was an integer, by the last rule, to which prefix the index of the integral part of the given number.

Thus, if the logarithm of the mixed decimal 149.5738 was required; find the logarithm of 1495738, without noticing the decimal point; this, in the last example, was found to be 17485; to this prefix the index 2, corresponding to the integral part 149; the logarithm sought will therefore be 2.17485.

*To find the logarithm of any decimal fraction less than unity.*

The index of the logarithm of any number less than unity is negative; but, to avoid the mixture of positive and negative quantities, it is common to borrow 10 or 100 in the index, which must afterwards be neglected in summing them with other indices; thus, instead of writing the index  $-1$ , it is usually written  $+9$ , or  $+99$ ; but in general it is sufficient to borrow 10 in the index; and it is what we shall do in the rest of this work. In this way we may find the logarithm of any decimal fraction by the following rule:

RULE. Find the logarithm of a fraction as if it was a whole number; see how many ciphers precede the first figure of the decimal fraction, subtract that number from 9, and the remainder will be the index of the given fraction.

Thus the logarithm of 0.0391 is 8.59218; the logarithm of 0.25 is 9.39794; the logarithm of 0.0000025 is 4.39794, &c.

*To find the logarithm of a vulgar fraction.*

RULE. Subtract the logarithm of the denominator from the logarithm of the numerator (borrowing 10 in the index when the denominator is the greatest); the remainder will be the logarithm of the fraction sought.

EXAMPLE I.

Required the logarithm of  $\frac{3}{8}$ .

From log. of 3.....	0.47712
Take log. of 8.....	0.90309
Remainder, log. of $\frac{3}{8}$ or .375.....	9.57403

EXAMPLE II.

Required the logarithm of  $3\frac{1}{4}$ , or  $4\frac{1}{2}$ .

From log. of 13.....	1.11394
Take log. of 4.....	0.60206
Remainder, log. of $3\frac{1}{4}$ or 3.25.....	0.51188

*To find the number corresponding to any logarithm.*

RULE. In the column marked 0 at the top (and bottom) of the table seek for the next less logarithm, neglecting the index; note the number against it, and carry the eye along that line until the nearest less logarithm to the given one is found and the fourth figure of the required number will be at the top, which is to be placed to the right of the three other figures; if greater accuracy is desired, take the difference,  $D$ , between this tabular logarithm and the next greater, also the difference,  $d$ , between that tabular logarithm and the given one; to the latter difference,  $d$ , annex two or more ciphers at the right hand, and divide it by the former difference,  $D$ , and place the quotient\* to the right hand of the four figures already found, and the number sought will be given, expressed in a mixed decimal, the integral part of which will consist of a number of figures (at the left hand) equal to the index of the logarithm increased by unity.†

Thus, if the number corresponding to the logarithm 1.52634 was required, find 52634 in the column marked 0 at the top or bottom, and opposite to it is 336; now, the index being 1, the sought number must consist of two integral places; therefore it is 33.6.

If the given logarithm was 2.32838, we find that 32838 stands in the column marked 0 at the top or bottom, directly opposite to 213, which is the number sought, because, the index being 2, the number must consist of three places of figures.

If the number corresponding to the logarithm 2.57345 was required, look in the column 0, and find in it, against the number 374, the logarithm 57287; and, guiding the eye along that line, find the given logarithm, 57345, in the column marked 5; therefore the mixed number sought is 3745; and, since the index is 2, the integral part must consist of 3 places; therefore the number sought is 374.5. If the index be 1, the number will be 37.45; and if the index be 0, the number will be 3.745. If the index be 8, corresponding to a number less than unity, the answer will be 0.03745, &c.

Again, if the number corresponding to the logarithm 5.57811 was required, look in the column 0, and find in it, against 378, and under 5, the logarithm 57807, the difference between this and the next greater logarithm, 57818, being 11, and the difference between 57807 and the given number, 57811, being 4; to this 4 affix two ciphers, which make 400, and divide it by 11; the quotient is 36 nearly; this number, being connected with the former four figures, makes 378536, which is the number required, since, the index being 5, the number must consist of six places of figures.

\* This quotient must consist of as many places of figures as there were ciphers annexed, conformable to the rules of the division of decimals. Thus, if the divisor was 40 and the number to which two ciphers were annexed was 2, making 2.00, the quotient must not be estimated as 5, but as 05, and then two figures must be placed to the right of the four figures before found.

† If the index corresponds to a fraction less than unity, place as many ciphers to the left of that number as are equal to the index subtracted from 9, the decimal point being placed to the left of these ciphers; in this manner the sought number will be found.

We may find the fifth figure of the required number by means of the marginal tables, by entering the table corresponding at the top to the proposed value of  $D$ , and in the right-hand column with  $d$ ; the corresponding number is the fifth figure of the required natural number.

To show, at one view, the indices corresponding to mixed and decimal numbers, see the following table :

Mixed number.	Logarithms.	Decimal number.	Logarithms.
40943. 0.....	Log. 4. 61218	0. 40943.....	Log. 9. 61218
4094. 3.....	Log. 3. 61218	0. 040943.....	Log. 8. 61218
400. 43.....	Log. 2. 61218	0. 0040943.....	Log. 7. 61218
40. 943.....	Log. 1. 61218	0. 00040943.....	Log. 6. 61218
4. 0943.....	Log. 0. 61218	0. 000040943.....	Log. 5. 61218

MULTIPLICATION BY LOGARITHMS.

RULE. Add the logarithms of the two numbers to be multiplied, and the sum will be the logarithm of their product.

EXAMPLE I.	
Multiply 25 by 35.	
25 .....	Log. 1. 39794
35 .....	Log. 1. 54407
<hr/>	
Product, 875 .....	Log. 2. 94201

EXAMPLE II.	
Multiply 22.4 by 1.8.	
22. 4 .....	Log. 1. 35025
1. 8 .....	Log. 0. 25527
<hr/>	
Product, 40. 32 .....	Log. 1. 60552

In the last example the sum of the two indices is 16; but since 10 was borrowed in each number, we have neglected 10 in the sum; and the remainder, 6, being less than the other 10, is evidently the index of the logarithm of a fraction less than unity.

DIVISION BY LOGARITHMS.

RULE. From the logarithm of the dividend subtract the logarithm of the divisor; the remainder will be the logarithm of the quotient.

EXAMPLE I.	
Divide 875 by 25.	
875 .....	Log. 2. 94201
25 .....	Log. 1. 39794
<hr/>	
Quotient, 35 .....	Log. 1. 54407

EXAMPLE II.	
Divide 40.32 by 22.4.	
40. 32 .....	Log. 1. 60552
22. 4 .....	Log. 1. 35025
<hr/>	
Quotient, 1. 8 .....	Log. 0. 25527

In Example III both the divisor and dividend are fractions less than unity, and the divisor is the least; consequently the quotient is greater than unity. In Example IV both fractions are less than unity; and, since the divisor is the greatest, its logarithm is greater than that of the dividend; for this reason it is necessary to borrow 10 in the index before making the subtraction; hence the quotient is less than unity.

EXAMPLE III.	
Multiply 3.26 by 0.0025.	
3. 26 .....	Log. 0. 51322
0. 0025 .....	Log. 7. 39794
<hr/>	
Product, 0. 00815 .....	Log. 7. 91116

EXAMPLE IV.	
Multiply 0.25 by 0.003.	
0. 25 .....	Log. 9. 39794
0. 003 .....	Log. 7. 47712
<hr/>	
Product, 0. 00075 .....	Log. 6. 87506

EXAMPLE III.	
Divide 0.00815 by 0.0025.	
0. 00815 .....	Log. 7. 91116
0. 0025 .....	Log. 7. 39794
<hr/>	
Quotient, 3. 26 .....	Log. 0. 51322

EXAMPLE IV.	
Divide 0.00075 by 0.025.	
0. 00075 .....	Log. 6. 87506
0. 025 .....	Log. 8. 39794
<hr/>	
Quotient, 0. 03 .....	Log. 8. 47712

INVOLUTION BY LOGARITHMS.

RULE. Multiply the logarithm of the number given by the index of the power to which the quantity is to be raised; the product will be the logarithm of the power sought. But in raising the powers of any decimal fraction it must be observed that the first significant figure of the power must be put as many places below the place of units as the index of its logarithm wants of 10 multiplied by the index of the power.

EXAMPLE I.	
Required the square of 18.	
18 .....	Log. 1. 25527
<hr/>	
Answer, 324 .....	Log. 2. 51054

EXAMPLE II.	
Required the cube of 13.	
13 .....	Log. 1. 11394
<hr/>	
Answer, 2197 .....	Log. 3. 34182

EXAMPLE III.

Required the square of 6.4.

6.4 ..... Log. 0.80618  
2

Answer, 40.  $\frac{1}{2}$ 6 ..... Log. 1.61236

In the last example the index 28 wants 2 of 30 (the product of 10 by the power 3); therefore the first significant figure of the answer, viz: 1, is placed two figures distant from the place of unity.

EVOLUTION BY LOGARITHMS.

RULE. Divide the logarithm of the number by the index of the power; the quotient will be the logarithm of the root sought. But if the power whose root is to be extracted is a decimal fraction less than unity, prefix to the index of its logarithm a figure less by one than the index of the power, \* and divide the whole by the index of the power; the quotient will be the logarithm of the root sought.

EXAMPLE I.

What is the square root of 324?

324 ..... Log. 2 ) 2.51055

Answer, 18 ..... Log. 1.25527

EXAMPLE II.

Required the cube root of 2197.

2197 ..... Log. 3 ) 3.34183

Answer, 13 ..... Log. 1.11394

EXAMPLE III.

Required the square root of 40.96.

40.96 ..... Log. 2 ) 1.61236

Answer, 6.4 ..... Log. 0.80618

EXAMPLE IV.

Required the cube root of 0.015625.

0.015625 ..... Log. 8.19382

Prefix 2 to the index ..... 3 ) 28.19382

Answer, 0.25 ..... Log. 9.39794

To work the Rule of Three by logarithms.

When three numbers are given to find a fourth proportional, in arithmetic, make a statement, and say, As the first number is to the second, so is the third to the fourth; and by multiplying the second and third together, and dividing the product by the first, we obtain the fourth number sought. To obtain the same result by logarithms add the logarithms of the second and third numbers together, and from the sum subtract the logarithm of the first number; the remainder will be the logarithm of the sought fourth number.

EXAMPLE I.

If 6 yards of cloth cost 5 dollars, what will 20 yards cost?

As 6 ..... Log. 0.77815

Is to 5 ..... Log. 0.69897

So is 20 ..... Log. 1.30103

Sum of 2d and 3d ..... 2.00000

Subtract the first ..... 0.77815

To 16.67 ..... Log. 1.22185

The answer, therefore, is 16 dollars and  $\frac{67}{100}$ , or 16 dollars and 67 cents.

EXAMPLE II.

If a ship sails 20 miles in 7 hours, how much will she sail in 21 hours at the same rate?

As 7 ..... Log. 0.84510

Is to 20 ..... Log. 1.30103

So is 21 ..... Log. 1.32222

Sum of 2d and 3d ..... 2.62325

Subtract the first ..... 0.84510

To 60 ..... Log. 1.77815

The answer is 60 miles.

To calculate compound interest by logarithms.

To 100 dollars add its interest for one year; find the logarithm of this sum, and reject 2 in the index; then multiply it by the number of years and parts of a year for which the interest is to be calculated; to the product add the logarithm of the sum put at interest; the sum of these two logarithms will be the logarithm of the amount of the given sum for the given time.

EXAMPLE.

Required the amount of the principal and interest of 355 dollars, at 6 per cent. compound interest, for 7 years.

Adding 6 to 100 gives 106; whose logarithm, rejecting 2 in the index, is ..... 0.02531

Multiplied by ..... 7

Product ..... 0.17717

Principal, 355 dollars ..... Log. 2.55023

Sum gives the logarithm of 533.83 ..... Log. 2.72740

Therefore the amount of principal and interest is 533 dollars and 83 cents.

\* In this rule it is supposed that 10 is borrowed in finding the index to the decimal.

To find the logarithm of the sine, tangent, or secant, corresponding to any number of degrees and minutes, by Table 44.

The given number of degrees must be found at the bottom of the page when between  $45^\circ$  and  $135^\circ$ , otherwise at the top; the minutes being found in the column marked M, which stands on the side of the page on which the degrees are marked; thus, if the degrees are less than  $45^\circ$ , the minutes are to be found in the left-hand column, &c., and it must be noted that if the degrees are found at the top, the names of hour, sine, cosine, tangent, &c., must also be found at the top; and if the degrees are found at the bottom, the names sine, cosine, &c., must also be found at the bottom. Then opposite to the number of the minutes will be found the log. sine, log. secant, &c., in the columns marked *sine*, *secant*, &c., respectively.

## EXAMPLE I.

Required the log. sine of  $28^\circ 37'$ .

Find  $28^\circ$  at the top of the page, directly below which, in the left-hand column, find  $37'$ ; against which, in the column marked *sine*, is 9.68029, the log. sine of the given number of degrees; and in the same manner the tangents, &c., are found.

## EXAMPLE II.

Required the log. secant of  $126^\circ 20'$ .

Find  $126^\circ$  at the bottom of the page, directly above which, in the left-hand column, find  $20'$ ; against which, in the column marked *secant*, is 10.22732 required.

To find the logarithm of the sine, cosine, &c., for degrees, minutes, and seconds, by Table 44.

Find the numbers corresponding to the even minutes next above and below the given degrees and minutes, and take their difference, D; then say, As  $60''$  is to the number of seconds in the proposed number, so is that difference, D, to a correction,  $d$ , to be applied to the number corresponding to the least number of degrees and minutes; additive if it is the least of the two numbers taken from the table, otherwise subtractive.

## EXAMPLE III.

Required the log. sine of  $24^\circ 16' 38''$ .

Sine of  $24^\circ 16'$  ..... Log. 9.61382  
Sine of  $24^\circ 17'$  ..... Log. 9.61411

Difference ..... D = 29

Then, as  $60'' : 38'' : 29 : 18$ , which, being added to the number corresponding to  $24^\circ 16'$ , gives 9.61400, the log. sine of  $24^\circ 16' 38''$ .

## EXAMPLE IV.

Required the log. secant of  $105^\circ 20' 16''$ .

Secant of  $105^\circ 20'$  ..... Log. 10.57768  
Secant of  $105^\circ 21'$  ..... Log. 10.57722

Difference ..... D = 46

Then, as  $60'' : 16'' : 46 : 12$ , which, being subtracted from the number corresponding to  $105^\circ 20'$ , gives 10.57756, the log. secant of  $105^\circ 20' 16''$ .

If the given seconds be  $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ , or  $\frac{1}{6}$ , or any other even parts of a minute, the like parts may be taken of the difference of the logarithms, and added or subtracted as above, which may be frequently done by inspection. These proportional parts may also be found very nearly by means of the three columns of differences for seconds, given, for the first time, in the ninth edition of this work. The first column of differences, which is to be used with the two columns marked A, A, is placed between these columns. The second column of differences, which is to be used with the two columns B, B, is placed between these two columns. In like manner the third column of differences, between the columns C, C, is to be used with them. The correction of the tabular logarithms in any of the columns A, B, C, for any number of seconds, is found by entering the left-hand column of the table, marked *S'* at the top, and finding the number of seconds; opposite to this, in the column of differences, will be found the corresponding correction. Thus, in the table, page 215, which contains the log. sines, tangents, &c., for  $30^\circ$ , the corrections corresponding to  $25''$ , are 9 for the columns A, A, 12 for the columns B, B, 3 for the columns C, C; so that, if it were required to find the sine, tangent, or secant of  $30^\circ 12' 25''$ , we must add these corrections respectively to the numbers corresponding to  $30^\circ 12'$ ; thus—

COL. A.	COL. B.	COL. C.
Logs. for $30^\circ 12'$ ..... Sine 9.70159	Tangent ..... 9.76493	Secant ..... 10.06335
Corrections for $25''$ in <i>S'</i> . + 9	+ 12	+ 3
Logs. for $30^\circ 12' 25''$ ..... 9.70168	9.76505	10.06338

These corrections being all added, because the logarithms increase in proceeding from  $30^\circ 12'$  to  $30^\circ 13'$ . Instead of taking out the logarithms for  $30^\circ 12'$ , and adding the correction for  $25''$ , we may take out the logarithms for  $30^\circ 13'$ , and subtract the correction for  $60'' - 25''$ , or  $35''$ , found in the margin *S'*; thus,

Logs for $30^\circ 13'$ ..... Sine 9.70180	Tangent ..... 9.76522	Secant ..... 10.06342
Corr. for $35''$ in col. <i>S'</i> , or 25'' in col. <i>G'</i> ..... - 13	- 17	- 4
Logs. for $30^\circ 12' 25''$ ..... 9.70167	9.76505	10.06338

The corrections are in this case subtracted, because the logarithms decrease in proceeding backward  $35''$  from  $30^\circ 13'$ , to attain  $30^\circ 12' 25''$ . The tangents and secants, in this example, are the same by both methods; the sines differ by one unit in the last decimal place, and this will frequently happen, because the difference of the logarithms for  $1'$  sometimes differ one or two units from the mean values which are used in the three columns of differences. The error arising from this cause is generally diminished by using the *smallest* angle, *S'*, when the seconds of the proposed angle are *smaller* than  $30''$ , or the *greatest* angle, *G'*, when the number of seconds are

\* If we neglect the seconds in any proposed angle whose sine, &c., is required, we get the angle denoted above by *S'*, and this angle, increased by  $1'$ , is represented by *G'*; so that the proposed angle falls between *S'* and *G'*, *S'* being a *smaller* and *G'* a *greater* angle than that whose log. sine, &c., is required; the letters *S'* and *G'*, accented for minutes, being used because they are easily remembered as the initials of *smaller* and *greater*.

greater than  $30''$ . Thus, in the above example, where the angle  $S' = 30^\circ 12'$ , and the angle  $G' = 30^\circ 13'$ , it is best to use the angle  $S'$  when the given angle is less than  $30^\circ 12' 30''$ , but the angle  $G'$  when it exceeds  $30^\circ 12' 30''$ . Thus, if it be required to find the sine of  $30^\circ 12' 51''$ , it is best to use the angle  $G' = 30^\circ 13'$ , and find the correction by entering the margin marked  $S'$  with the difference  $60'' - 51'' = 9''$ , opposite to which, in the column of differences, is 3, to be subtracted from log. sine  $30^\circ 13' = 9.70180$ , to get the log. sine of  $30^\circ 12' 51'' = 9.70177$ . To save the trouble of subtracting the seconds from  $60''$ , we may use the right-hand margin, marked  $G'$ , and the correction may then be found by the following rules:

RULE 1. When the *smallest* angle  $S'$  is used, *find the seconds in the column  $S'$  and take out the corresponding correction*, which is to be applied to the logarithm corresponding to  $S'$ ; by adding, if the log. of  $G'$  be greater than the log. of  $S'$ ; otherwise, by subtracting.

RULE 2. When the *greater* angle  $G'$  is used, *find the seconds in the column  $G'$  and take out the corresponding correction*, which is to be applied to the logarithm corresponding to  $G'$ ; by adding, if the log. of  $S'$  be greater than the log. of  $G'$ ; otherwise, by subtracting; so that, in all cases, the required logarithm may fall between the two logarithms corresponding to the angles  $S'$  and  $G'$ .

The correctness of these rules will evidently appear by comparing them with the preceding examples; and by the inverse process we may find the angle corresponding to a given logarithm, as in the next article.

We have given at the bottom of the page, in this table, a small table for finding the proportional parts for the odd seconds of time, corresponding to the column of Hours A. M. or P. M., to facilitate the process of finding the log. sine, cosine, &c., corresponding to the nearest second of time in the column of hours, or, on the contrary, to find the nearest second of time corresponding to any given log. sine, cosine, &c. Thus, in the preceding examples, where the angle  $S' = 30^\circ 12'$  and the angle  $G' = 30^\circ 13'$ , the times corresponding in the column of Hours P. M. are  $S' = 4^h 1^m 36^s$ ,  $G' = 4^h 1^m 44^s$ ; and if we wish to find the log. sine, cosine, &c., corresponding to any intermediate time, as, for example,  $4^h 1^m 39^s$ , which differs  $3^s$  from the angle  $S'$ , we must find the tabular logarithm corresponding to  $S'$  and apply the correction for  $3^s$ , given by the table at the bottom of the page, as in the following examples:

	A.	B.	C.
Logs. for $S' = 4^h 1^m 36^s$	Sine..... 9. 70159	Tangent .... 9. 76493	Secant ..... 10. 06335
Correction for ..... $+ 3^s$	$+ 8$	$+ 11$	$+ 3$
Logs. for ..... $4^h 1^m 39^s$	Sine..... 9. 70167	Tangent .... 9. 76504	Secant ..... 10. 06338

Nearly the same results are obtained by using the angle  $G'$  in the manner we have before explained:

	A.	B.	C.
Logs. for $G' = 4^h 1^m 44^s$	Sine..... 9. 70180	Tangent .... 9. 76522	Secant ..... 10. 06342
Correction for ..... $- 5^s$	$- 13$	$- 18$	$- 5$
Logs. for ..... $4^h 1^m 39^s$	Sine..... 9. 70167	Tangent .... 9. 76504	Secant ..... 10. 06337

These corrections must be applied by addition or subtraction, according to the directions given above, so as to make the required logarithm fall between those which correspond to the times  $S'$  and  $G'$ .

The inverse process will give the time corresponding to any logarithm. Thus, if the log. sine 9.70167 be given, the difference between this and 9.70159, corresponding to  $S' = 4^h 1^m 36^s$ , is 8; seeking this in the column A, in the second line of the table at the bottom of the page, it is found to correspond to  $3^s$ ; adding this to the time  $S' = 4^h 1^m 36^s$ , we get  $4^h 1^m 39^s$  for the required time. We may proceed in the same manner with the logarithms in the columns B, C, using the numbers corresponding, marked B, C, respectively, in the table at the bottom of the page.

To find the degrees, minutes, and seconds corresponding to any given logarithm sine, cosine, &c., by Table 44.

Find the two nearest numbers to the given log. sine, cosine, &c., in the column marked *Sine, Cosine, &c.*, respectively, one being greater and the other less, and take their difference, D; take also the difference, d, between the given logarithm and the logarithm corresponding to the smallest number of degrees and minutes; then say, As the first found difference is to the second found difference so is  $60''$  to a number of seconds to be annexed to the smallest number of degrees and minutes before found. The three columns of differences may also be used by an inverse operation to that which we have explained in the preceding article.

#### EXAMPLE V.

Find the degrees, minutes, and seconds (less than  $90^\circ$ ) corresponding to the log. sine 9.61400.

Next less log. $S' = 24^\circ 16'$ .....	9. 61382	Log. of smallest angle $S' = 24^\circ 16'$ is.....	9. 61382
Greater..... $G' = 24^\circ 17'$ .....	9. 61411	Given log.....	9. 61400
D = 29		d = 18	

Then say, As  $29 : 18 :: 60'' : 38''$ , nearly; which, annexed to  $24^\circ 16'$ , give  $24^\circ 16' 38''$ , answering to the log. sine 9.61400. Subtracting  $24^\circ 16' 38''$  from  $180^\circ$ , there remain  $155^\circ 43' 22''$ , the log. sine of which is also 9.61400. The quantity  $38''$  may also be found by inspection in the side column  $S'$  of the page opposite  $d = 18$ , in the column of differences between the two columns, A, A. If we use the angle  $G'$ , we shall have  $d'$  equal to 11, the difference of the logarithms 9.61411 and 9.61400, and the corresponding number of seconds in column  $G'$  is  $37''$ , making  $24^\circ 16' 37''$ .

To find the arithmetical complement of any logarithm.

The arithmetical complement of any logarithm is what it wants of 10.00000, and is used to avoid subtraction. For, when working any proportion by logarithms, the arithmetical complement of the logarithm of the first term may be added, instead of subtracting the logarithm itself, observing to neglect 10 in the index of the sum of the logarithms. The arithmetical complement of any logarithm is thus found: Begin at the index and write down what each figure wants of 9, except the last significant figure, which take from 10.\* Thus, the arithmetical complement of 9.62595 is 0.37405, that of 1.86567 is 8.13433, and that of 10.33133 is 89.66867, or 9.66867.

\* When the index of the given logarithm is greater than 10, as in some of the numbers of Table 44, the left-hand figure of it must be neglected; and when there are any ciphers to the right hand of the last significant figure, place the same number of ciphers to the right hand of the other figures of the arithmetical complement.
